# Part 1 2014 RN Practice Analysis: Linking the NCLEX-RN® Examination to Practice U.S. Respondents

National Council of State Boards of Nursing, Inc. (NCSBN®)

#### É EC I ES MMA

The National Council of State Boards of Nursing (NCSBN®) is responsible to its members, the boards of nursing in the U.S. and its member board territories for the preparation of psychometrically sound and legally defensible licensure examinations. The periodic performance of practice analysis (i.e., job analysis) studies assists NCSBN in evaluating the validity of the test plan that guides content distribution of the licensure examination. Because the U.S. health care industry is rapidly changing, practice analysis studies are traditionally conducted on a three-year cycle.

A number of steps are necessary to perform an analysis of newly licensed registered nurse (RN) practice. A panel of subject matter experts was assembled, a list of RN activities was created and incorporated into a survey that was sent to a

survey had three forms that were evenly distributed among 6,000 newly licensed RNs. A "ve-stage mailing process was used to engage the participants in the study. All potential participants were promised con"dentiality with regard to their participation and their responses. The survey was conducted from April through June 2014.

#### eturn ates

Out of the 6,000 paper surveys mailed out, 757 were returned for Form 1 and 758 were received for Form 2. With 71 undeliverable surveys, the adjusted return rate is 25.5% for paper survey. Out of the 6,000 Web surveys delivered, 731 surveys were received for Form 1, 754 surveys were received for Form 2, and 699 for Form 3. The return rate was 36.4% for the Web survey. There were 955 individuals (446 paper, 509 Web) who did not qualify for survey ratings based on one of the following reasons: (a) they did not indicate having an RN license; (b) they were not currently working in the U.S.; (c) they were working less than 20 hours per week as an RN; and/or (d) they failed to answer the previous two demographic questions. After adjusting for incorrect addresses and removals, the analyzable response rates were 18.0% for paper and 27.9% for Web.

### N Practice Anal sis Sur e Nonres onder Stud

In order to ensure the validity of the results, NCSBN conducted a telephone survey of nonrespondents to determine if those RNs not responding would have rated the survey activity statements differently. Based on the nonrespondent data, the ratings for nonrespondents were similar to the ratings of respondents which provide support to the validity of the survey results.

## De ogra ics, E eriences and Practice En iron ents of Partici ants

#### De ogra ics/Past E eriences

The majority (87.6%) of survey respondents reported were female. The age of respondent nurses averaged 31.6 years (SD 8.8 years). The respondents were 74.2% White, 10.5% African American, 6.1% Hispanic, 4.1% Asian, and 1.0% Asian Indian.

Newly licensed RNs listed obtaining an associate degree most frequently (54.7%) as the educational preparation for initial RN licensure. The second most frequent response was the baccalaureate degree (40.4%).

Respondents reported working an average of 3.4 months as RNs in the U.S. and its territories. On average, respondents indicated earning a nursing degree 7.4 months prior to taking the survey. Approximately 16.0% of newly licensed RNs reported previous experience as a licensed practical/vocational nurse (LPN/VN) and 43.6% reported previous experience as a nurse aide (NA). The average experience in those positions was 6.1 years as an LPN/VN and 4.7 years as an NA.

#### Orientation

The majority of newly licensed RNs received some form of formal orientation (95.4%). No formal orientation was reported by 4.6% and 1.2% reported having only classroom instruction or skills lab work for their orientation. The majority of newly licensed RNs reported working with an assigned preceptor (66.5%) for an average of 8.3 weeks. In the next largest group, 13.6% reported having a formal internship that lasted an average of 13.7 weeks, while just 11.2% of respondents indicated performing supervised work with patients for an average of 6.3 weeks.

#### Certi cations Earned

In the current survey, Basic Life Support (57.4%), Advanced Cardiac Life Support (24.2%), and Intravenous Therapy (12.8%) were the most frequently reported certi"cations.

#### **Facilities**

The majority (72.0%) of newly licensed RNs in this study reported working in hospitals. The next largest group, of around 15%, reported working in long-term care while just fewer than 10% reported working in community-based facilities.

Related to the size of the facilities in which respondents work, the bulk of newly licensed RNs in this study indicated working in hospitals with at least 100 beds. The majority of respondents (27%) work

in a facility with 100-299 beds, followed by 21% of respondents in facilities with 500 or more beds, and lastly facilities with 300-499 beds included 19% of the sample. Only 16.5% of respondents indicated working in facilities containing less than 100 beds. Almost 53% of newly licensed RNs in this study reported working in urban or metropolitan areas, 31.8% in suburban areas, and 15.3% in rural areas.

#### **Practice Settings**

The majority of newly licensed RNs reported working in the medical/surgical (27.7%) and critical care (18.7%) settings. Nursing home, skilled or immediate care made up 11.2% of the current sample, followed by rehabilitation (5.5%) and stepdown/progressive care (4.3%). Only 0.1% reported working in the occupational health settings.

#### Client Healt Conditions and Ages

Newly licensed RNs reported caring for acutely ill clients (50.0%), clients with stable chronic conditions (38.8%), clients with unstable chronic conditions (29.0%) and clients with behavior/emotional conditions (25.3%). The majority of newly licensed RNs reported caring for older adult clients aged 65 to 85 (54.3%), adult clients aged 18 to 64 (52.8%), older surveys had a reliability index of about 0.97 for adult clients aged 85 plus (30.2%) and young adult clients aged 13 to 17 (7.0%).

#### S ifts or ed

The shifts most commonly worked by newly licensed RNs continued to be days (43.8%) and nights (31.4%). Only 12.5% reported working rotating shifts.

#### e S ent in Different Categories of Nursing Acti ities

Newly licensed RNs reported spending the greatest amount of time in Management of Care (17.6%), Physiological Adaption (13.8%), and Pharmacological and Parenteral Therapies (13.2%).

#### Ad inistrati e es onsi ilities/Pri ar Ad inistrati e Position

Of the respondents, 21.4% reported having administrative responsibilities and of those respondents, 43.4% reported having a primary administrative position. Those working in long-term care facilities were far more likely to report having administrative responsibilities than those working in hospitals (60.6% in long-term care vs. 9.4% in hospitals). Those working in long-term care with administrative responsibilities were more than three times as likely to report being in a primary administrative position than those working in hospitals (61.2% of those working in long-term care reported having an administrative position compared to 20.8% of those working in hospitals). Of those working in community-based settings, 37.7% reported having administrative responsibilities. Of those respondents, 48.8% reported holding a primary administrative position.

#### Acti it Perfor ance Findings

#### elia ilit

Reliability indices were calculated to assess the capability of the survey to measure the activities relevant to safe and effective practice of newly licensed RNs. Cranach's alpha coef"cients were calculated for frequency and importance ratings for the paper and Web forms of the survey. Paper importance and about 0.96 for frequency ratings, which is quite good. Web surveys had a reliability index of .96 for importance and 0.95 for frequency ratings. These high-reliability indices indicate the survey is reliably measuring the nursing activities necessary for competent RN practice.

#### SME Panel alidation of Sur e Findings

The subject matter expert panel for the 2014 RN Practice Analysis was asked to provide independent ratings of the 139 activity statements. The importance ratings estimated by panel members were compared to the average importance ratings from the practice analysis survey. In general, respondents regarded most of the activity statements as more important

f23liabilits rega(e)]TJ T\* pr

(89.3%) indicated that the survey covered the important nursing activities •wellŽ or •very well.Ž

#### A \_lica ilit of Acti ities to Practice Setting

Respondents indicated if each of the activities was applicable to his or her work setting. The activities ranged from 21.5% applicability (21.5% of the respondents reported that the activity was performed within their work setting) to 99.9% (99.9% of the respondents reported the activity was performed within their work setting).

#### Fre uenc of Acti it Perfor ance

Respondents were asked to rate the frequency of performance of all activities that were applicable to their work setting on a six-point scale: •0 timesŽ to •5 times or more.Ž Average frequency statistics were calculated in two ways: setting-speci"c frequency of activity performance and total group frequency. Average setting-speci"c frequencies ranged from 0.67 to 4.94. Average total group frequencies ranged from 0.20 to 4.94.

#### ♦ ortance of Acti it Perfor ance

Respondents were asked to rate the importance of performing each nursing activity in regard to the maintenance of client safety and/or threat of complications or distress using a "ve point scale: •1Ž (not important) to •5Ž (critically important). Average setting-speci"c importance ratings ranged from 3.52 to 4.91. Average total group importance ratings ranged from 3.31 to 4.91.

#### Swe\_e\_ar

Respondents to the 2014 RN Practice Analysis found the activities listed in the survey to be representative of the work they performed in their practice settings. In general, the importance ratings of SMEs and respondents were similar (correlation = 0.85), supporting the validity of the results. The reliability of the survey instrument was quite good. In addition, activities with the lowest average total group frequency and importance ratings corresponded, in general, to those activities performed in specialized areas of nursing practice.

#### Conclusion

The 2014 RN Practice Analysis used several methods to describe the practice of newly licensed RNs in the U.S.: (1) document reviews; (2) daily logs of newly licensed RNs; (3) subject matter experts knowledge; and (4) a large scale survey. The reliability of the survey instrument was quite good. In addition, there was evidence to support the validity of the activity statement ratings. Based on evidence, the "ndings of this study can be used to evaluate and support an RN test plan.

# Part 1 2014 RN Practice Analysis: Linking the NCLEX-RN® Examination to Practice U.S. Respondents

National Council of State Boards of Nursing, Inc. (NCSBN®)

The National Council of State Boards of Nursing (NCSBN®) is responsible to its members, the boards of nursing in the U.S. and its member board territories for the preparation of psychometrically defensible sound and legally examinations. The periodic performance of practice analysis (i.e., job analysis) studies assists NCSBN in evaluating the validity of the test plan that guides content distribution of the licensure examination. Furthermore, practice analysis studies have long been recognized by measurement and testing professions as important sources of validity evidence for licensure examinations (AERA, APA, and NCME,

After the activity statements were reviewed and approved by the NEC, twelve panel members provided information necessary for validation of the practice analysis survey. They estimated the percentage of nurses in the country that would perform the activity within their practice settings, the average frequency with which each activity would be performed daily by nurses performing the activity (on a 0 to 5+ scale) and the average importance the activity would have in relation to the provision of safe client care (on a 1 to 5 scale).

#### Sur e De elo 👡 ent

A number of processes were used to create, evaluate and re"ne the survey instrument used for the 2014 RN Practice Analysis study. The activity statements created by the panel of experts were reviewed, edited and approved by the NCLEX® Examination Committee. The committee also reviewed the survey form. Additionally, the practice analysis methodology reviewers approved the methodology and procedures. For this survey, both paper and Web-based (Web) versions of the survey were utilized in order to continue the investigation of using only a Web-based survey for practice analyses (NCSBN 2008).

There were 139 nursing activity statements that were incorporated into a practice analysis survey. The survey also included questions about the nurses• practice settings, past experiences and demographics. Half of the sample of newly registered nurses received a paper version of the survey. Two forms of the paper survey were created to decrease the number of activity statements contained on each survey. The other half of the sample received one of three Web versions of the survey. Three forms of the Web survey were created to reduce the number of activity statements on each survey.

For the paper survey, one survey form contained 70 activity statements while the other 69 statements. There were no shared activity statements between the survey forms. There were three Web versions of the survey, two of the Web surveys contained 46 activity statements and one of the Web surveys contained 47 activity statements, without

shared activity statements. Except for the activity statements, all surveys were identical.

The survey contained six sections. In the "rst section there were questions related to type of RN license, working in the U.S., and direct care of clients. Activity statements were also in this section. The second section contained questions about months of work experience as an RN, type and length of work orientation, and certi"cations earned. The third section focused on work environment including type and age of clients, employment setting, and type and size of facility. The fourth section requested information on the respondents. last day of work including numbers of hours worked, numbers of clients for whom care was provided and the amount of time spent in various types of nursing activities. The "fth section asked basic demographic information. The sixth section provided space for respondents to write comments or suggestions about the study. All forms of the Web and paper versions of the survey used in the 2014 RN Practice Analysis may be found in Appendix C.

#### Sur e Process

#### Sa le Selection

Two samples were randomly selected from the candidates who successfully passed the NCLEX-RN examination from Oct. 1, 2013, through March 31, 2014, and were not previously included in the 2014 Knowledge of Newly Licensed Registered Nurses survey. First, a sample of 6,000 practitioners were randomly selected for the paper survey. Newly licensed RNs were excluded from this sample if their mailing address was not within the jurisdiction in which they were seeking licensure. The exclusion criterion was used to minimize the number of incorrect addresses to which the survey would be sent. The strategy effectively removed all candidates with international addresses. Then, of the remaining candidate pool, candidates with email addresses were extracted. A sample of 6,000 RN candidates was randomly selected from this population for the Web survey.

#### e resentati eness

The sample selected for this study was proportionally equivalent to the population from which the sample was drawn in terms of NCSBN jurisdictions. Table 1 presents the correspondence between the population, the sample and the respondents by NCSBN jurisdiction.

#### **Mailing Procedure**

The paper survey was sent to 6,000 newly licensed RNs (half receiving Form 1 and the other half receiving Form 2). The Web survey was sent to the other 6,000 newly licensed RNs; the three versions of the Web survey were distributed evenly among the sample.

#### N Practice Anal sis Sur e Nonres onder Stud

In order to ensure the validity of the results, NCSBN conducted a telephone survey of nonrespondents to determine if those RNs not responding would have rated the survey activity statements differently than the respondents. If there are no systematic differences in respondents versus nonrespondents, we have further evidence that the results are unbiased, which supports of the validity of the 2014 RN Practice Analysis results. The nonrespondents rated the activity statements similar to the respondents, lending support for the validity of the results. See Appendix H for a full report of the nonrespondent study.

#### Sue\_e\_ar

A panel of 12 registered RNs, subject matter experts in the practice of newly licensed RNs, met and created a comprehensive list of RN activity statements. A data collection instrument was developed and revised before being sent to 12,000 newly licensed RNs selected from lists of candidates who passed the NCLEX-RN examination between Oct. 1, 2013, and March 31, 2014. The survey response rate was 18.0% for paper and 27.9% for Web. This practice analysis contains the responses of 2,744 newly licensed RNs.

#### De ogra ics/Past E eriences

Demographic information, including racial and ethnic backgrounds, educational preparation, and gender, are presented next, followed by descriptions of respondents• work environments, including settings, shifts worked and client characteristics.

#### Age and Gender

In 2014, the majority of survey respondents reported being female (87.6%), a slight decrease from the percentage found in the 2011 RN Practice Analysis study. See Figure 1 for gender. The age of respondent nurses averaged 31.6 years (SD= 8.8 years), similar to the average of 31.1 years from the 2011 survey.

#### Educational Bac ground

Newly licensed RNs indicated obtaining an associate degree most frequently (54.7%). The second most frequently chosen response was baccalaureate degree (40.4%). It should be noted that this year's survey included an •In progress to complete generic Master\*sŽ which was not included in 2011. See Figure 3 for the educational background of the respondents.

#### Pre ious Licensed Practical/ ocational Nurse (LPN/ N) or Nurse Aide/Nursing Assistant (NA) E erience

Respondents reported working an average of 3.4 months as RNs in the US. and reported being an average of 7.4 out from graduating a nursing program. These data are displayed in *Figure 4*.

Approximately 16.0% of newly licensed RNs reported previous experience as an LPN/VN and 43.6% reported previous experience as a nurse aide (NA). The average experience in those positions was 63 years as a LPN/VN and 3.6 years as an NA. These data are tabulated in *Table 2*.

#### ace/Et nicit of Ne I Licensed Ns

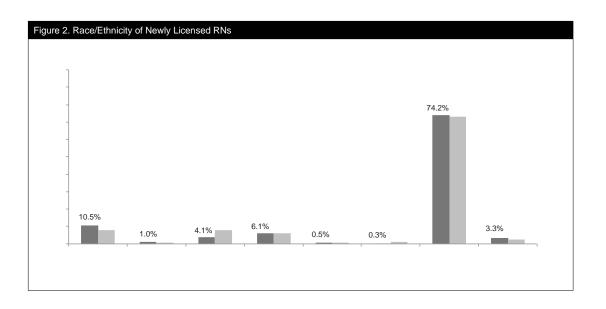

Participants in the current survey were ethnically diverse, with 74.2% reporting being White. In the current survey, the respondents reported their race/ ethnicity as follows: 10.5% African American; 6.1% Hispanic; 4.1% Asian Other; 1.0% Asian Indian. See *Figure 2* for newly licensed RNs racial/ethnic backgrounds

Of the respondents, 87.7% reported English as their primary language and 9.4% had both English and another language as their primary languages. The primary language of the remaining 2.9% of respondents was not English.

#### Orientation

The majority of newly licensed RNs responded receiving some form of formal orientation (95.4%). No formal orientation was reported by 4.6% and 1.2% reported having only classroom instruction

Nopionts roximately 166 yeweeks

a le 3.     e and Lengt of Orientation

Other	3.3	3.8

speci"c categories of activities (see Table 8). The hours spent were then converted to proportions of time by dividing the hours reported spent on each activity by the number of hours reported spent working. Because nurses often perform more than one type of activity at a time, such as teaching while giving medications or providing emotional support while giving routine care, these proportions did not equal 1. In order to make the proportions of time spent in activities useful to the task of helping to validate the NCLEX-RN test plan, the proportions were standardized by dividing the time spent in each category of activity by the sum of hours reportedly spent in all the activities. These standardized proportions have the advantage of adding up to 1. Newly licensed RNs reported spending the greatest amount of time in management of care (18%), physiological adaption (14%), and pharmacological and parenteral therapies (13%). The relatively least amount of time was reportedly spent on health promotion and maintenance activities (11%), psychosocial integrity (11%), and reduction of risk potential (11%). Compared to the 2011 study, there are only very slight variations in time spent on almost all categories of activities.

#### Ade inistrati e es onsi ilities/Prie ar Ade inistrati e Position

The newly licensed RNs esponding to the practice analysis survey were asked if they had administrative responsibilities within their nursing position such as being a unit manager, a team leader, charge nurse, or a coordinator. If they reported such responsibilities, they were asked if they had a primary administrative position. Of all respondents, 21.4% reported having such responsibilities and of those respondents who reported having administrative responsibilities, 43.4% reported having a primary administrative position. Those working in long-term care facilities were more likely to report having administrative responsibilities than those working in hospitals (60.6% in long-term care vs. 9.4% in hospitals). In addition, those working in long-term care with administrative responsibilities were three times as likely to report being in a primary administrative position than those working in hospitals (61.2% of those working in long-term care reported having a primary administrative position compared to 20.8%

of those working in hospitals). Of those working in community-based settings, 37.7% reported having administrative responsibilities. Of those respondents, 46.8% reported holding a primary administrative position. Compared to 2011, these results represent a slight increase in administrative responsibilities overall, but a decrease in every type of facility with the exception of Community-based care in holding a primary administrative position. See Table 9 for detailed results of administrative responsibilities.

#### Sue\_e\_ar

The newly licensed RNs responding to the 2014 RN Practice Analysis survey were primarily female with an average age of 31.6 years. The majority worked day or night shifts in medical/surgical or critical care

survey. As can be seen in Table 11, there were no times or more.Ž Average frequency statistics differences greater than 0.70 between the SME ratings and the newly licensed RNs. In general, the respondents rated most of the activity statements slightly more important than the SMEs did.

#### e resentati eness of Acti it State, ents

Respondents were asked whether the activities on their survey form represented what they actually did in their positions. A large majority of participants (89.3%) indicated that the survey covered the important nursing activities •wellŽ or •very well.Ž

### A <u>lica</u> ilit of Acti ities to Practice Setting

Respondents indicated if each of the activities was not applicable to his or her work setting by marking •Never performed in work setting.Ž The percentages of newly licensed nurses indicating that the activities were applicable are reported in Table 12. The activities ranged from 21.5% applicability (21.5% of the respondents reported that the activity was performed within their work settings) to 100.0% (100.0% of the respondents reported the activity was performed within their work setting). The activities with the lowest percentage of applicability were •Provide care and education to a client in labor and antepartum clientŽ (21.5%), •Provide post-partum care and educationŽ (23.0%) and •Provide care and education for the newborn less than 1 month old through the infant or toddler client through 2 yearsŽ (26.7%). The activities with the highest percentage of applicability for respondents were Organize workload to manage time effectivelyŽ (100.0%) and •Apply principles of infection control (e.g., hand hygiene, surgical asepsis, isolation, sterile technique, universal/standard precautions)Ž (100.0%).

#### Fre uenc of Acti it Performance

Respondents were asked to rate the frequency of performance of all activities that were applicable to their work settings. They reported how frequently they performed the activity on the last day they worked using a six-point scale: •0 timesŽ to •5

times or more.Ž Average frequency statistics were calculated in two ways. The setting-speci"c frequency was calculated by averaging the frequency ratings of those respondents providing ratings (i.e., respondents indicating that the activity applied to their work setting). The total group frequency was calculated by including the missing frequency ratings (i.e., respondents indicating that the activity did not apply to their work setting) before averaging the rating. To do this, the missing frequency ratings were converted to zero (•0 timesŽ on the rating scale) for inclusion in the total group

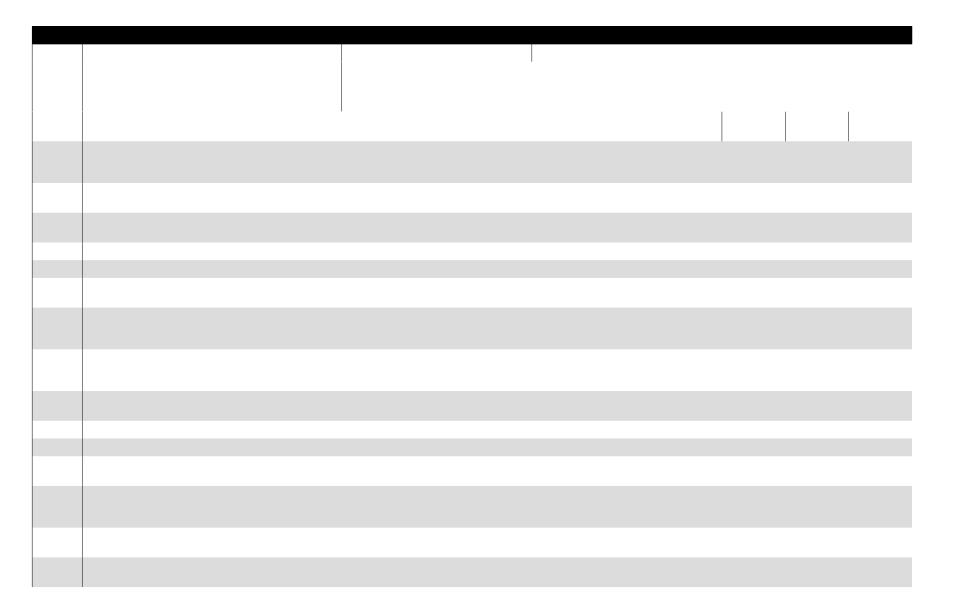

the legal scope of practiceŽ (4.82), and •Ensure proper identi"cation of client when providing careŽ (4.80). Appendix E presents activity statements rank ordered by average total group frequency.

#### ♠ ortance of Acti it Performance

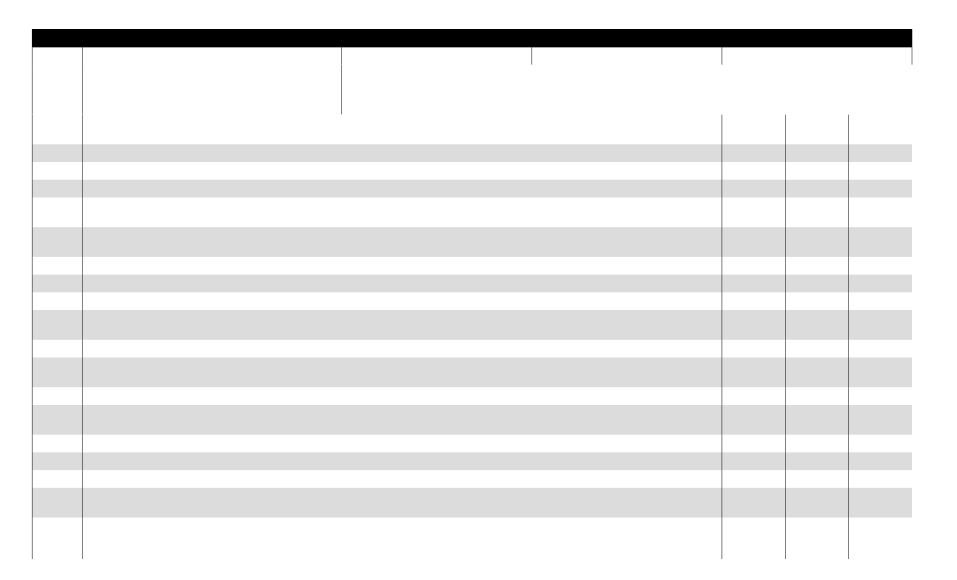

Respondents were asked to rate the importance of performing each nursing activity in regard to the maintenance of client safety and/or threat of complications or distress. Respondents were further requested to consider the importance of activity performance in terms of client safety, namely risk of unnecessary complications, impairment of function or serious distress to clients. Importance ratings were recorded using a "ve-point scale of •1Ž (Not Important) to •5Ž (Critically Important). Average importance ratings were calculated in two ways. Setting-speci"c importance was calculated by averaging only the ratings of respondents providing frequency ratings for the activity statement (those indicating that the activity applied to their work setting). The total group importance was calculated by including all importance ratings regardless of applicability to work setting. The average importance rating for each of the 139 activities is reported in Table 13.

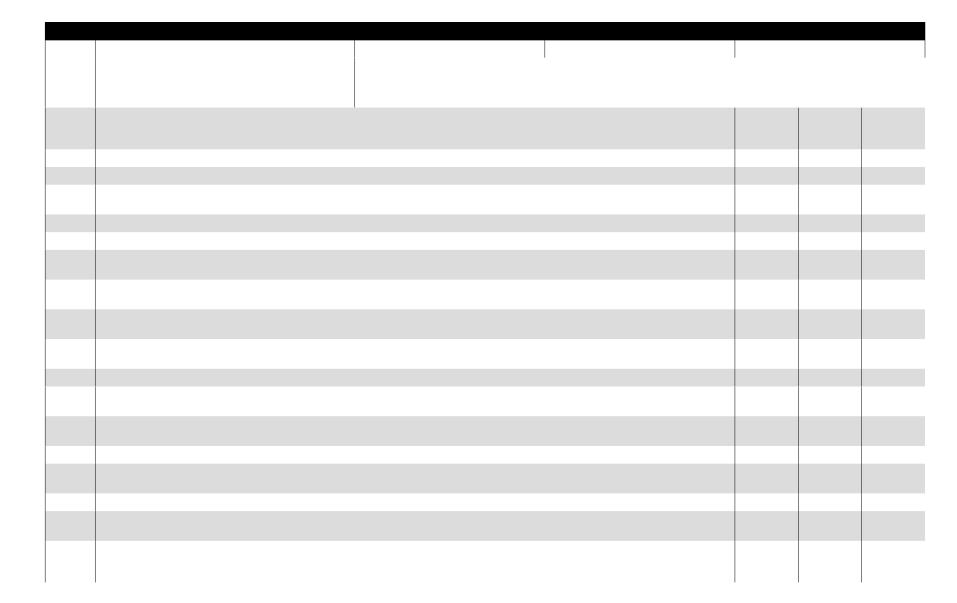

#### Setting-S eci c

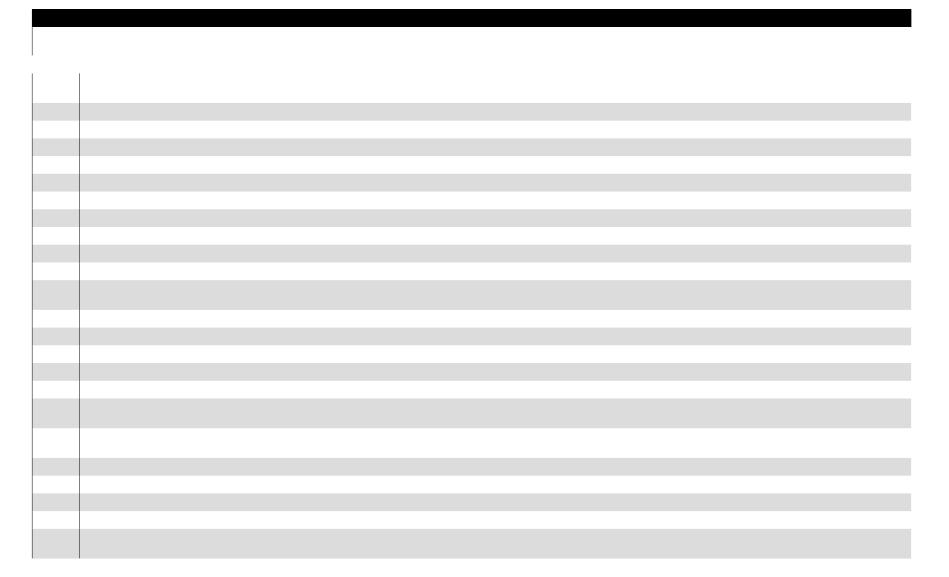

Average setting-speci"c importance ratings ranged from 3.52 to 4.91. The activities with the lowest importance ratings were •Recognize complementary therapies and identify potential contraindications

## APPENDÏ A: 2014 N P AC ICE ANAL SIS ME HODOLOG È PE

err Ac en an, PhD, is a professor at the University of North Carolina at Greensboro (UNCG). His research specializations include unidimensional and multidimensional item response theory, differential item/test functioning, and computerized testing. Dr. Ackerman has published extensively in journals such as Applied Psychological Measurement, Journal of Educational Measurement, Journal of the American Statistical Association and Journal of Educational Statistics. Some leadership roles that exemplify Dr. Ackerman's service to the "elds of assessment and measurement include acting as President of the National Council on Measurement in Education, Chair of the U.S. Department of Defense Advisory Committee, member of the Psychometric Oversight Committee for the American Institute of Certi"ed Public Accountants, and current chair of the GRE Technical Advisory Committee. At UNCG, Dr. Ackerman serves as the Associate Dean of Research and Assessment for the School of Education. He is also a Senior Fellow for the Of"ce of Assessment, Evaluation, and Research Services (OAERS) and teaches Intermediate Statistical Methods in Education and Multidimensional Item Response Theory.

u- un (Kat erine) C in, PhD, is an assistant director of psychometric consulting at Buros Center for Testing at the University of Nebraska-Lincoln. Her works in Buros Center include developing grant activities, providing technical advice and outreach efforts to improve testing, assessment, and measurement practices through consultation and education, with special emphases in psychology and education. Her research interests include value-added models, classi "cation accuracy of diagnostic methods, survey response styles, survey response latency, and analyzing panelist data in standard settings. Dr. Chin has published in journals such as *Journal of Applied Testing Technology and Psychological Reports*.

ong ei ang, PhD, is a principal researcher, Methodology and Predictive Analytics, Gallup, Inc. His work in Gallup involves managing and conducting research. This includes designing and implementing research-based organizational interventions as well as evaluating the business impact of such interventions. It also includes leading the development of testing and survey tools that are business-relevant and psychometrically sound. His research interests include valid and defensible use of testing and survey outcomes, testing and surveys in multi-country, multi-cultural, and multi-lingual settings, analytics and modeling for complex organizational issues (recruiting, hiring, performance management, well-being, retention, etc.), improvements to measurement through improving items and questionnaire designs, administration procedures, and scoring or information extraction methods, and applications of technology-enhanced assessments. Dr. Yang has published in journals such a\$ocial Science Computer Review, International Journal of Social Research Methodology, Journal of Cross-Cultural Psychology, Journal of Applied Testing Technology, International Journal of Testing and Applied Measurement in Education.

## 8

1. What is the total number of months you have worked as an RN in the U.S. or its territories?

2. Have you ever worked outside the U.S. or its territories as an RN?

## SECTION 3: WORK ENVIRONMENT

- Which of the following <u>best</u> describes <u>most</u> of your clients on the last day you worked?(Select <u>AL</u>L that apply)
  - Well clients, possibly with minor illnesses
  - OB (Maternity) clients
- Clients with stabilized chronic conditions
- Clients with unstabilized chronic conditions
- Clients with acute conditions, including clients with medical, surgical or critical conditions
- Clients at end-of-life
- Clients with behavioral/emotional conditions

## SECTION 5: DEMOGRAPHIC INFORMATION

In this section you are asked to provide background information that will be summarized to describe the group that completed this survey. No individual responses will be reported.

1. Did you work as an unlicensed assistive personnel prior to becoming an RN?  Yes J If "yes," for how many years and months?	

This survey is being performed by the National Council of State Boards of Nursing (NCSBN) on behalf of your board of nursing/regulatory body. The survey is part of a comprehensive study of the practice of newly licensed registered nurses (RNs) in the NCSBN areas using the NCLEX® examination for primary licensure decisions.

INTRODUCTION	
1. What type(s) of nursing license do you hold?	(Select ALL that apply)

Page 2

## **SECTION 1: NURSING ACTIVITIES**

This section contains a list of activities descriptive of nursing practice in a variety of settings. Please note that some activities may not apply to your setting. For each activity, two questions are asked. Please answer both questions.

QUESTION A - FREQUENCY: : If the activity is performed in your work setting, how often (0 Times, 1 Time, 2 Times, 3 Times, 4 Times, or 5+ Times) did you personally perform the activity on the last day you worked? If it is never performed in your work setting or is not applicable, then select "NEVER performed in work setting" and then respond to Question B - Importance.

QUESTION B - IMPORTANCE: : How important is performing this nursing activity in regard to client safety? Consider the importance with regard to the risk of unnecessary complications, impairment of function, or serious distress to clients. Rate all activities.

NOTE: Inclusion of an activity on this practice analysis survey does not imply that the activity is or would be included in the RN scope of practice defined by any specific jurisdiction. You must refer to your local board of nursing/regulatory body for information about your scope of practice.

Question A — FREQUENCY - If an activity does not apply to your work setting \_\_\_\_\_\_, choose "Never performed in work setting \_\_\_\_\_ ", still select the importance rating as noted in Question B and then move on to the next activity. If an activity is performed in your work setting \_\_\_\_ select 0 -5+ reflecting the frequency of performing the activity on your last day of work \_\_\_\_, then complete Question B.

Question B — IMPORTANCE - Rate the overall importance of this activity considering client safety, and/or threat of complications or distress with 1 = Not Important, 2 = Minimally Important, 3 = Moderately Important, 4 = Important, 5 = Critically Important.

A - Frequency \_\_\_\_\_\_ B - Importance

18 Provide care and education for the adult client ages 65 through 85 years and over	
19 Assess psychosocial, spiritual and occupational factors affecting care, and plan interventions

You may write any comments or suggestions that you have in the space below.			

This survey is being performed by the National Council of State Boards of Nursing (NCSBN) on behalf of your board of nursing/regulatory body. The survey is part of a comprehensive study of the practice of newly licensed registered nurses (RNs) in the NCSBN areas using the NCLEX® examination for primary licensure decisions. Please complete this survey as soon as possible. This is your opportunity to contribute to the development of the NCLEX® examination that future candidates will take.

#### Instructions:

Please read each question carefully and respond by selecting the option that most closely represents your answer. Choose the answer that <u>best</u> applies to your practice and select the appropriate response(s). A few questions ask you to enter information.

You will notice that many questions ask you to report what you did on your <u>last day of work</u>. It is important that we obtain information from nurses experiencing both typical and unusual workdays, so please answer the questions according to what you did on your last day of work even if that day was not typical.

As used in this survey, the "client" can be an individual, family, or group which includes significant others and population. "Clients" are the same as "residents" or "patients." Your answers will be kept confidential and your individual responses to the questions will not be released.

#### Survey Progression:

To progress through the survey, please use the navigation buttons located at the bottom of each page:

1. What type(s) of nursing license do you hold?

INTRODUCTION	
2. Are you currently working as an RN in the U.S. or a Member Board jurisdiction?	

## SECTION 1: NURSING ACTIVITIES

This section contains a list of activities descriptive of nursing practice in a variety of settings. Please note that some activities may not apply to your setting. For each activity, two questions are asked. Please answer both questions.

QUESTION A - FREQUENCY: : If the activity is performed in your work setting, how often (0 Times, 1 Time, 2 Times, 3 Times, 4 Times, or 5+ Times) did you personally perform the activity on the last day you worked? If it is never performed in your work setting or is not applicable, then select "NEVER performed in work setting" and then respond to Question B - Importance.

QUESTION B - IMPORTANCE: : How important is performing this nursing activity in regard to client safety? Consider the importance with regard to the risk of unnecessary complications, impairment of function, or serious distress to clients. Rate all activities.

NOTE: Inclusion of an activity on this practice analysis survey does not imply that the activity is or would be included in the RN scope of practice defined by any specific jurisdiction. You must refer to your local board of nursing/regulatory body for information about your scope of practice.

Question A — FREQUENCY - If an activity does not apply to your work setting , choose "Never performed in work setting ", still select the importance rating as noted in Question B and then move on to the next activity. If an activity is performed in your work setting select 0 -5+ reflecting the frequency of performing the activity on your last day of work , then complete Question B.

Question B -

18 Assess client ability to manage care in home environment and plan care accordingly (e.g., equipment, community resources)	
19 Assess client for abuse or neglect and intervene as8558 l,	
equipment, community resources)	

# **SECTION 1: NURSING ACTIVITIES**

	A - Frequency	B - Importance
26 Apply and maintain devices used to promote venous return (e.g., anti-embolic stockings, sequential compression devices)		
27 Manage the client's nutritional intake (e.g., adjust diet, monitor height and weight)		
28 Implement measures to promote circulation (e.g., active or passive range of motion, positioning and mobilization)		
29 Prepare and administer medications, using rights of medication administration		

48. How well did the survey cover the important activities a newly licensed RN should

SECTION 2: EXPERIENCE AND ORIENTATION
1. What is the total number of months you have worked as an RN in the U.S or its territories? Please enter a positive, whole number only (e.g., 20).

# APPENDIX H: 2014 RN PRACTICE ANALYSIS SURVEY NONRESPONDER STUDY

#### Introduction

The National Council of State Boards of Nursing (NCSBN®) conducts practice analysis studies every three years to assess the practice environment and emerging practice changes. Although the response rate for the 2014 RN Practice Analysis had an adequate return rate of approximately 23%, many individuals did not respond to the survey. Out of the 12,000 newly licensed RNs who were invited to take the survey, only 3,699 returned the survey. NCSBN wanted to contact a sample of the invitees who chose not to participate in the survey to ascertain the reasons for not returning the survey and compare a sample of activity statements, as well as demographic information against the RN practice survey respondents.

were mailed the paper form of the RN practice analysis survey. 48 RNs from this sof psy.elrer379 Tw, Nationaa of the 12,006 Tw [(ysis 1e\*93 1 Tfi8TJ T\* .Nf)18(omehow18) diff form maye a shaveermine if they licensed RNs and wer

### Background of Study

NCSBN is responsible to its members, the boards of nursing in the U.S. and member board territories for the preparation of psychometrically sound and legally defensible licensure examinations. The periodic performance of practice analysis (i.e., job analysis) studies assists NCSBN in evaluating the validity of the test plan that guides content distribution of the licensure examination.

Findings from the 2014 RN Practice Analysis Nonrespondent Study will provide possible reasons why individuals do not participate in surveys and differences between survey respondents and nonrespondents to determine if the nonrespondents were systematically different in terms of demographics and ratings of the activity statements. This study was conducted to determine if the results for the practice analysis were somehow biased.

# Methodology

#### Sample Selection

A random sample of newly selected RNs who were invited, but did not respond to the RN practice analysis survey was contacted via telephone. The sample was derived from the 6,000 invitees who

# Part 2 2014 RN Practice Analysis: Linking the NCLEX-RN® Examination to Practice Canadian Respondents

National Council of State Boards of Nursing, Inc. (NCSBN®)

## Sur e Process

### Sa le Selection

NCSBN received a list of 2,297 RNs licensed/registered within 10 Canadian regulatory bodies between Oct. 1, 2013, and March 31, 2014. Because the size of the population was relatively small, it was unnecessary and unreasonable to draw strati"ed random samples

respectively. Almost 63.3% of newly licensed/registered RNs in this study reported working in urban or metropolitan areas, 18.6% in rural areas, and 18.1% in suburban areas.

#### **Practice Settings**

The majority of newly licensed/registered RNs reported working in the medical/surgical (32.0%) and critical care (10.1%) settings. Nursing home, skilled or immediate care made up 6.3% of the current sample, followed by home health, including visiting nurses associations (4.9%) and other long-term care (e.g., residential care, developmental disability) (4.7%).

#### Client Healt Conditions and Ages

Newly licensed/registered RNs reported caring for acutely ill clients (42.6%), clients with stable chronic conditions (31.2%), clients with behavioral/emotional conditions (27.4%) and clients with unstabilized chronic conditions (22.9%). The majority of newly licensed/registered RNs reported caring for older adult clients aged 65 to 85 (47.5%), adult clients aged 18 to 64 (41.4%), older adult clients over age

## A lica ilit of Acti ities to Practice Setting

Respondents indicated if each of the activities was applicable to his or her work setting. The activities ranged from 23.7% applicability (23.7% of the respondents reported that the activity was performed within their work setting) to 100.0% (100.0% of the respondents reported the activity was performed within their work setting).

#### Fre uenc of Acti it Perfor ance

Respondents were asked to rate the frequency of performance of all activities that were applicable to their work setting on a six-point scale: •0 timesŽ to •5 times or more.Ž Average frequency statistics were calculated in two ways: setting-speci"c frequency of activity performance and total group frequency. Average setting-speci"c frequencies ranged from 0.31 to 4.90. Average total group frequencies ranged from 0.11 to 4.85.

#### ♦ ortance of Acti it Performance

Respondents were asked to rate the importance of performing each nursing activity in regard to the maintenance of client safety and/or threat of complications or distress using a "ve point scale: •1Ž (not important) to •5Ž (critically important). Average setting-speci"c importance ratings ranged from 3.28 to 4.89. Average total group importance ratings ranged from 3.10 to 4.89.

# Swe\_ve\_ar

Respondents to the 2014 RN practice analysis found the activities listed in the survey to be representative of the work they performed in their practice settings. In general, the importance ratings of SMEs and respondents were similar (correlation = 0.80), supporting the validity of the results. The reliability of the survey instrument was quite good. In addition, activities with the lowest average total group frequency and importance ratings corresponded, in general, to those activities performed in specialized areas of nursing practice.

#### Conclusion

The 2014 RN Practice Analysis used several methods to describe the practice of newly licensed/registered RNs in the U.S. and Canadian territories/jurisdictions: (1) document reviews; (2) daily logs of newly licensed/registered RNs; (3) subject matter experts knowledge; and (4) a large scale survey. The reliability of the survey instrument was quite good. In addition, there was evidence to support the validity of the activity statement ratings.

and of those respondents, 30.2% reported having a primary administrative position. Those working in long-term care facilities were far more likely to report having administrative responsibilities than those working in hospitals (86.8% in long-term care vs. 25.4% in hospitals). Those working in longterm care with administrative responsibilities were more than three times as likely to report being in a primary administrative position than those working in hospitals (56.3% of those working in long-term care reported having an administrative position compared to 14.3% of those working in hospitals). Of those working in community-based settings, 43.8% reported having administrative responsibilities. Of those respondents, 42.9% reported holding a primary administrative position. See Table 9 for more details.

# Swe\_ ar

The newly licensed/registered Canadian RNs responding to the 2014 RN Practice Analysis survey were primarily female with an average age of 30.0 years. The majority worked day or rotating shifts in medical/surgical or critical care units of hospitals. The majority of respondents were provided an

# A lica ilit of Acti ities to Practice Setting

Respondents indicated if each of the activities was not applicable to his or her work setting by marking •Never performed in work setting.Ž The percentages of newly licensed/registered nurses indicating that the activities were applicable are reported in Table 11. The activities ranged from 23.7% applicability (23.7% of the respondents reported that the activity was performed within their work settings) to 100.0% (100.0% of the respondents reported the activity was performed within their work setting). The activities with the lowest percentage of applicability were •Perform hemodialysis or continuous renal replacement therapyŽ (23.7%), •Provide post-partum care and educationŽ (31.4%) and •Provide care and education to a client in labor or antepartum clientŽ (31.5%). There are 13 activities with the highest percentage of applicability (100.0%). Some of those activities are •Maintain client con"dentiality and privacy, Ž • Protect client from injury (e.g., falls, electrical hazards). Žand •Handle and maintain medication in a safe and controlled environment.Ž See Table 11 for more details on applicability of activities to practice setting.

# Fre uenc of Acti it Performance

Respondents were asked to rate the frequency of performance of all activities that were applicable to their work settings. They reported how frequently they performed the activity on the last day they worked using a six-point scale: •0 timesŽ to •5 times or more.Ž Average frequency statistics were calculated in two ways. The setting-speci'c frequency was calculated by averaging the frequency ratings of those respondents providing ratings (i.e., respondents indicating that the activity applied to their work setting). The total group frequency was calculated by including the missing frequency ratings (i.e., respondents indicating that the activity did not apply to their work setting) before averaging the rating. To do this, the missing frequency ratings were converted to zero (•0 timesŽ on the rating scale) for inclusion in the total group frequency calculation. See Table 11 for settingspeci"c and total group frequency.

#### Setting-S eci c

Average setting-speci"c frequencies ranged from 0.31 to 4.90. The activities performed with the lowest frequencies were •Perform and manage care of client receiving peritoneal dialysisŽ (0.31), •Implement and monitor phototherapyŽ (0.33), and •Assist with invasive procedures (e.g., central line, thoracentesis, bronchoscopy)Ž (0.47). The activities with the highest setting-speci"c average frequencies of performance were •Provide care within the legal scope of practiceŽ (4.90), •Apply principles of infection control (e.g., hand hygiene, surgical asepsis, isolation, sterile technique, universal/standard precautions)Ž (4.89), •Maintain client con"dentiality and privacyŽ (4.75) and •Ensure proper identi"cation of client when providing careŽ (4.69).

#### otal Grou

Average total group frequencies ranged from 0.11 to 4.85. The activities performed with the lowest total group frequency were •Implement and monitor phototherapyŽ (0.11), •Perform hemodialysis or continuous renal replacement therapyŽ (0.13), and •Perform and manage care of client receiving dialysisŽ (0.14).peritoneal Those performed with the overall highest frequencies were •Apply principles of infection control (e.g., hand hygiene, surgical asepsis, isolation, sterile technique, universal/standard precautions)Ž (4.85), •Provide care within the legal scope of practiceŽ (4.85), •Maintain client con"dentiality and privacyŽ (4.75) and •Ensure proper identi"cation of client when providing careŽ (4.69).

INTRODUCTION
4. In your current position, do you provide direct care to clients? ( Note: Faculty supervision of student clinical experiences is not considered "direct care." )  Yes, 20 or more hours per week, on average  Yes, less than 20 hours per week, on average  No

Page 5

This section contains a list of activities descriptive of nursing practice in a variety of settings. Please note that some activities may not apply to your setting. For each activity, two questions are asked. Please answer both questions.

QUESTION A - FREQUENCY: : If the activity is performed in your work setting, how often (0 Times, 1 Time, 2 Times, 3 Times, 4 Times, or 5+ Times) did you personally perform the activity on the last day you worked? If it is never performed in your work setting or is not applicable, then select "NEVER performed in work setting" and then respond to Question B - Importance.

QUESTION B

Question A — FREQUENCY - If an activity does not apply to your work setting , choose "Never performed in work setting ", still select the importance rating as noted in Question B and then move on to the next activity. If an activity is performed in your work setting select 0 -5+ reflecting the frequency of performing the activity on your last day of work , then complete Question B.

Question B — IMPORTANCE - Rate the overall importance of this activity considering client safety, and/or threat of complications or distress with 1 = Not Important, 2 = Minimally Important, 3 = Moderately Important, 4 = Important, 5 = Critically Important.

A - Frequency B - Importance
